1) Every step has a request and a response.

2) They are 3 steps.

3) We need just the server because the client will connect to this server.

4) It's necessary to create with the TCP/P server the port 5500 because the client just connects to this port.

5) It's necessary to store a log for every step.

6) In the step 2. It's necessary to do an explode because we just need the subtotal and total value, and how you can see the clients sends a very long string.

7) In the step two, it's necessary to get a folio from database.
